Chapter 1

Known issues in the current version of NVML library

This is a list of known NVML issues in the current driver:

- On Linux when X Server is running [nvmlDeviceGetComputeRunningProcesses](#) may return a [nvmlProcessInfo_t::usedGpuMemory](#) value that is larger than the actual value. This will be fixed in a future release.
- On Linux GPU Reset can't be triggered when there is pending GPU Operation Mode (GOM) change
- On Linux GPU Reset may not successfully change pending ECC mode. A full reboot may be required to enable the mode change.
- [Accounting Statistics](#) supports only one process per GPU at a time (CUDA proxy server counts as one process).
- [nvmlAccountingStats_t::time](#) reports time and utilization values starting from cuInit till process termination. Next driver versions might change this behavior slightly and account process only from cuCtxCreate till cuCtxDestroy.
- On GPUs from Fermi family current P0 clocks (reported by [nvmlDeviceGetClockInfo](#)) can differ from max clocks by few MHz.

Chapter 2

Change log of NVML library

This chapter list changes in API and bug fixes that were introduced to the library

2.1 Changes between NVML v5.319 Update and v331

The following new functionality is exposed on NVIDIA display drivers version 331 Production or later

- Added [nvmlDeviceGetMinorNumber](#) to get the minor number for the device.
- Added [nvmlDeviceGetBAR1MemoryInfo](#) to get BAR1 total, available and used memory size.
- Added [nvmlDeviceGetBridgeChipInfo](#) to get the information related to bridge chip firmware.
- Added enforced power limit query API [nvmlDeviceGetEnforcedPowerLimit](#).

2.2 Changes between NVML v5.319 RC and v5.319 Update

The following new functionality is exposed on NVIDIA display drivers version 319 Update or later

- Added [nvmlDeviceSetAPIRestriction](#) and [nvmlDeviceGetAPIRestriction](#), with initial ability to toggle root-only requirement for [nvmlDeviceSetApplicationsClocks](#) and [nvmlDeviceResetApplicationsClocks](#).

2.3 Changes between NVML v4.304 and v5.319 RC

The following new functionality is exposed on NVIDIA display drivers version 319 Production or later

- IMPORTANT: Added _v2 versions of [nvmlDeviceGetHandleByIndex](#) and [nvmlDeviceGetCount](#) that also count devices not accessible by current user
 - IMPORTANT: [nvmlDeviceGetHandleByIndex_v2](#) (default) can also return `NVML_ERROR_NO_PERMISSION`
- Added [nvmlInit_v2](#) and [nvmlDeviceGetHandleByIndex_v2](#) that is safer and thus recommended function for initializing the library
 - [nvmlInit_v2](#) lazily initializes only requested devices (queried with [nvmlDeviceGetHandle*](#))
 - `nvml.h` defines [nvmlInit_v2](#) and [nvmlDeviceGetHandleByIndex_v2](#) as default functions
- Added [nvmlDeviceGetIndex](#)
- Added [NVML_ERROR_GPU_IS_LOST](#) to report GPUs that have fallen off the bus.
 - Note: All NVML device APIs can return this error code, as a GPU can fall off the bus at any time.
- Added new class of APIs for gathering process statistics ([Accounting Statistics](#))
- Application Clocks are no longer supported on GPU's from Quadro product line
- Added APIs to support dynamic page retirement. See [nvmlDeviceGetRetiredPages](#) and [nvmlDeviceGetRetiredPagesPendingStatus](#)

- Renamed `nvmlClocksThrottleReasonUserDefinedClocks` to `nvmlClocksThrottleReasonApplicationsClocksSetting`. Old name is deprecated and can be removed in one of the next major releases.
- Added `nvmlDeviceGetDisplayActive` and updated documentation to clarify how it differs from `nvmlDeviceGetDisplayMode`

2.4 Changes between NVML v4.304 RC and v4.304 Production

The following new functionality is exposed on NVIDIA display drivers version 304 Production or later

- Added `nvmlDeviceGetGpuOperationMode` and `nvmlDeviceSetGpuOperationMode`

2.5 Changes between NVML v3.295 and v4.304 RC

The following new functionality is exposed on NVIDIA display drivers version 304 RC or later

- Added `nvmlDeviceGetCurrentClocksThrottleReasons` and `nvmlDeviceGetSupportedClocksThrottleReasons`
- `NVML_CLOCK_SM` is now also reported on supported Kepler devices.
- Dropped support for GT200 based Tesla brand GPUs: C1060, M1060, S1070

2.6 Changes between NVML v2.285 and v3.295

The following new functionality is exposed on NVIDIA display drivers version 295 or later

- deprecated `nvmlDeviceGetHandleBySerial` in favor of newly added `nvmlDeviceGetHandleByUUID`
- Marked the input parameters of `nvmlDeviceGetHandleBySerial`, `nvmlDeviceGetHandleByUUID` and `nvmlDeviceGetHandleByPciBusId` as const
- Added `nvmlDeviceOnSameBoard`

- Added [Constants](#) defines
- Added [nvmlDeviceGetMaxPcieLinkGeneration](#), [nvmlDeviceGetMaxPcieLinkWidth](#), [nvmlDeviceGetCurrPcieLinkGeneration](#), [nvmlDeviceGetCurrPcieLinkWidth](#)
- Format change of [nvmlDeviceGetUUID](#) output to match the UUID standard. This function will return a different value.
- [nvmlDeviceGetDetailedEccErrors](#) will report zero for unsupported ECC error counters when a subset of ECC error counters are supported

2.7 Changes between NVML v1.0 and v2.285

The following new functionality is exposed on NVIDIA display drivers version 285 or later

- Added possibility to query separately current and pending driver model with [nvmlDeviceGetDriverModel](#)

- Changed format of `pciBusId` string (to `XXXX:XX:XX.X`) of [nvmlPciInfo_t](#)
- Parsing of `busId` in [nvmlDeviceGetHandleByPciBusId](#) is less restrictive. You can pass `0:2:0.0` or `0000:02:00` and other variations
- Added API for events waiting for GPU events (Linux only) see docs of [Event Handling Methods](#)
- Added API [nvmlDeviceGetComputeRunningProcesses](#) and [nvmlSystemGetProcessName](#) functions for looking up currently running compute applications

Chapter 3

Deprecated List

Class [nvmlEccErrorCounts_t](#) Different GPU families can have different memory error counters See [nvmlDeviceGetMemoryErrorCounter](#)

Global [NVML_DOUBLE_BIT_ECC](#) Mapped to [NVML_MEMORY_ERROR_TYPE_UNCORRECTED](#)

Global [NVML_SINGLE_BIT_ECC](#) Mapped to [NVML_MEMORY_ERROR_TYPE_CORRECTED](#)

Global [nvmlEccBitType_t](#) See [nvmlMemoryErrorType_t](#) for a more flexible type

Global [nvmlDeviceGetDetailedEccErrors](#) This API supports only a fixed set of ECC error locations On different GPU architectures different locations are supported See [nvmlDeviceGetMemoryErrorCounter](#)

Global [nvmlDeviceGetHandleBySerial](#) Since more than one GPU can exist on a single board this function is deprecated in favor of [nvmlDeviceGetHandleByUUID](#). For dual GPU boards this function will return [NVML_ERROR_INVALID_ARGUMENT](#).

Global [nvmlClocksThrottleReasonUserDefinedClocks](#) Renamed to [nvmlClocksThrottleReasonApplicationsClocksSetting](#) as the name describes the situation more accurately.

6.4.2 Define Documentation

6.4.2.1 `#define nvmlEventTypeClock 0x0000000000000010LL`

Kepler only

6.4.2.2 `#define nvmlEventTypeDoubleBitEccError 0x0000000000000002LL`

Note:

An uncorrected texture memory error is not an ECC error, so it does not generate a double bit event

6.4.2.3 #define nvmlEventTypePState 0x0000000000000004LL**Note:**

On Fermi architecture PState changes are also an indicator that GPU is throttling down due to no work being executed on the GPU, power capping or thermal capping. In a typical situation, Fermi-based GPU should stay in P0 for the duration of the execution of the compute process.

6.4.2.4 #define nvmlEventTypeSingleBitEccError 0x0000000000000001LL**Note:**

A corrected texture memory error is not an ECC error, so it does not generate a single bit event

[nvmlDeviceGetAccountingStats](#)

[nvmlDeviceGetAccountingPids](#)

Parameters:

device The identifier of the target device

Queries list of processes that can be queried for accounting stats.

For Tesla™ and Quadro® products from the Kepler family.

To just query the number of processes ready to be queried, call this function with `*count = 0` and `pids=NULL`. The return code will be `NVML_ERROR_INSUFFICIENT_SIZE`, or `NVML_SUCCESS` if list is empty.

For more details see [nvmlDeviceGetAccountingStats](#).

Note:

In case of PID collision some processes might not be accessible before the circular buffer is full.

See also:

[nvmlDeviceGetAccountingBufferSize](#)

6.5.2.5 `nvmlReturn_t DECLDIR nvmlDeviceGetAccountingStats (nvmlDevice_t device, unsigned int pid, nvmlAccountingStats_t * stats)`

Queries process's accounting stats.

For Tesla™ and Quadro® products from the Kepler family.

Accounting stats capture GPU utilization and other statistics across the lifetime of a process. Accounting stats can be queried during life time of the process and after its termination. Accounting stats are kept in a circular buffer, newly created processes overwrite information about old processes.

See [nvmlAccountingStats_t](#) for description of each returned metric. List of processes that can be queried can be retrieved from [nvmlDeviceGetAccountingPids](#).

Note:

Accounting Mode needs to be on. See [nvmlDeviceGetAccountingMode](#).

Only compute and graphics applications stats can be queried. Monitoring applications stats can't be queried since they don't contribute to GPU utilization.

In case of pid collision stats of only the latest process (that terminated last) will be reported

Warning:

On Kepler devices per process statistics are accurate only if there's one process running on a GPU.

Parameters:

device The identifier of the target device
pid Process Id of the target process to query stats for
stats Reference in which to return the process's accounting stats

Returns:

- [NVML_SUCCESS](#) if stats have been successfully retrieved
- [NVML_ERROR_UNINITIALIZED](#) if the library has not been successfully initialized

Enabling accounting mode has no negative impact on the GPU performance.

Disabling accounting clears all accounting pids information.

See [nvmlDeviceGetAccountingMode](#) See [nvmlDeviceGetAccountingStats](#) See [nvmlDeviceClearAccountingPids](#)

Parameters:

device The identifier of the target device
mode The target accounting mode

Returns:

6.6 Initialization and Cleanup

Functions

- [nvmlReturn_t](#) DECLDIR [nvmlInit](#) (void)
- [nvmlReturn_t](#) DECLDIR [nvmlShutdown](#) (void)

6.6.1 Detailed Description

This chapter describes the methods that handle NVML initialization and cleanup. It is the user's responsibility to call [nvmlInit\(\)](#) before calling any other methods, and [nvmlShutdown\(\)](#) once NVML is no longer being used.

6.6.2 Function Documentation

6.6.2.1 [nvmlReturn_t](#) DECLDIR [nvmlInit](#) (void)

Initialize NVML, but don't initialize any GPUs yet.

Note:

In NVML 5.319 new [nvmlInit_v2](#) has replaced [nvmlInit_v1](#) (default in NVML 4.304 and older) that did initialize all GPU devices in the system.

This allows NVML to communicate with a GPU when other GPUs in the system are unstable or in a bad state. When using this API, GPUs are discovered and initialized in [nvmlDeviceGetHandleBy*](#) functions instead.

Note:

To contrast [nvmlInit_v2](#) with [nvmlInit_v1](#), NVML 4.304 [nvmlInit_v1](#) will fail when any detected GPU is in a bad or unstable state.

For all products.

This method, should be called once before invoking any other methods in the library. A reference count of the number of initializations is maintained. Shutdown only occurs when the reference count reaches zero.

Returns:

- [NVML_SUCCESS](#) if NVML has been properly initialized
- [NVML_ERROR_DRIVER_NOT_LOADED](#) if NVIDIA driver is not running
- [NVML_ERROR_NO_PERMISSION](#) if NVML does not have permission to talk to the driver
- [NVML_ERROR_UNKNOWN](#) on any unexpected error

6.6.2.2 [nvmlReturn_t](#) DECLDIR [nvmlShutdown](#) (void)

Shut down NVML by releasing all GPU resources previously allocated with [nvmlInit\(\)](#).

For all products.

This method should be called after NVML work is done, once for each call to [nvmlInit\(\)](#). A reference count of the number of initializations is maintained. Shutdown only occurs when the reference count reaches zero. For backwards compatibility, no error is reported if [nvmlShutdown\(\)](#) is called more times than [nvmlInit\(\)](#).

Returns:

- [NVML_SUCCESS](#) if NVML has been properly shut down
- [NVML_ERROR_UNINITIALIZED](#) if the library has not been successfully initialized
- [NVML_ERROR_UNKNOWN](#) on any unexpected error

6.7 Error reporting

Functions

6.11.2.7 `nvmlReturn_t DECLDIR nvmlDeviceGetComputeRunningProcesses (nvmlDevice_t device, unsigned int * infoCount, nvmlProcessInfo_t * infos)`

Get information about processes with a compute context on a device

For Tesla™ and Quadro® products from the Fermi and Kepler families.

This function returns information only about compute running processes (e.g. CUDA application which have active context). Any graphics applications (e.g. using OpenGL, DirectX) won't be listed by this function.

To query the current number of running compute processes, call this function with `*infoCount = 0`. The return code will be `NVML_ERROR_INSUFFICIENT_SIZE`, or `NVML_SUCCESS` if none are running. For this call *infos* is allowed to be `NULL`.

Keep in mind that information returned by this call is dynamic and the number of elements might change in time. Allocate more space for *infos* table in case new compute processes are spawned.

Parameters:

device The identifier of the target device

infoCount Reference in which to provide the *infos* array size, and to return the number of returned elements

infos Reference in which to return the process information

Returns:

- [NVML_SUCCESS](#) if *infoCount* and *infos* have been populated

- [NVML_ERROR_GPU_IS_LOST](#) if the target GPU has fallen off the bus or is otherwise inaccessible
- [NVML_ERROR_UNKNOWN](#) on any unexpected error

[nvmlSystemGetProcessName](#)

6.11.2.8 `nvmlReturn_t DECLDIR nvmlDeviceGetCount (unsigned int * deviceCount)`

Retrieves the number of compute devices in the system. A compute device is a single GPU.

For all products.

Note: New `nvmlDeviceGetCount_v2` (default in NVML 5.319) returns count of all devices in the system even if `nvmlDeviceGetHandleByIndex_v2` returns `NVML_ERROR_NO_PERMISSION` for such device. Update your code to handle this error, or use NVML 4.304 or older `nvml` header file. For backward binary compatibility reasons `_v1` version of the API is still present in the shared library. Old `_v1` version of `nvmlDeviceGetCount` doesn't count devices that NVML has no permission to talk to.

Parameters:

deviceCount Reference in which to return the number of accessible devices

Returns:

- [NVML_SUCCESS](#) if *deviceCount* has been set
- [NVML_ERROR_UNINITIALIZED](#) if the library has not been successfully initialized
- [NVML_ERROR_INVALID_ARGUMENT](#) if *deviceCount* is `NULL`

More than one bit can be enabled at the same time. Multiple reasons can be affecting clocks at once.

Parameters:

device The identifier of the target device

clocksThrottleReasons Reference in which to return bitmask of active clocks throttle reasons

Returns:

- [NVML_SUCCESS](#) if *clocksThrottleReasons* has been set
- [NVML_ERROR_UNINITIALIZED](#) if the library has not been successfully initialized

6.11.2.21 `nvmlReturn_t DECLDIR nvmlDeviceGetHandleByIndex (unsigned int index, nvmlDevice_t * device)`

Acquire the handle for a particular device, based on its index.

For all products.

Valid indices are derived from the *accessibleDevices* count returned by [nvmlDeviceGetCount\(\)](#). For example, if *accessibleDevices* is 2 the valid indices are 0 and 1, corresponding to GPU 0 and GPU 1.

The order in which NVML enumerates devices has no guarantees of consistency between reboots. For that reason it is recommended that devices be looked up by their PCI ids or UUID. See [nvmlDeviceGetHandleByUUID\(\)](#) and [nvmlDeviceGetHandleByPciBusId\(\)](#).

Note: The NVML index may not correlate with other APIs, such as the CUDA device index.

Starting from NVML 5, this API causes NVML to initialize the target GPU NVML may initialize additional GPUs if:

- The target GPU is an SLI slave

Note: New `nvmlDeviceGetCount_v2` (default in NVML 5.319) returns count of all devices in the system even if `nvmlDeviceGetHandleByIndex_v2` returns `NVML_ERROR_NO_PERMISSION` for such device. Update your code to handle this error, or use NVML 4.304 or older nvml header file. For backward binary compatibility reasons `_v1` version of the API is still present in the shared library. Old `_v1` version of `nvmlDeviceGetCount` doesn't count devices that NVML has no permission to talk to.

This means that `nvmlDeviceGetHandleByIndex_v2` and `_v1` can return different devices for the same index. If you don't touch macros that map old (`_v1`) versions to `_v2` versions at the top of the file you don't need to worry about that.

Parameters:

index The index of the target GPU, ≥ 0 and $< accessibleDevices$

device Reference in which to return the device handle

Returns:

- [NVML_SUCCESS](#) if *device* has been set
- [NVML_ERROR_UNINITIALIZED](#) if the library has not been successfully initialized
- [NVML_ERROR_INVALID_ARGUMENT](#) if *index* is invalid or *device* is NULL
- [NVML_ERROR_INSUFFICIENT_POWER](#) if any attached devices have improperly attached external power cables

For all products.

This value corresponds to the [nvmlPciInfo_t::busId](#) returned by [nvmlDeviceGetPciInfo\(\)](#).

Starting from NVML 5, this API causes NVML to initialize the target GPU NVML may initialize additional GPUs if:

- The target GPU is an SLI slave

Note:

NVML 4.304 and older version of `nvmlDeviceGetHandleByPciBusId_v1` returns `NVML_ERROR_NOT_FOUND` instead of `NVML_ERROR_NO_PERMISSION`.

Parameters:

pciBusId The PCI bus id of the target GPU

device Reference in which to return the device handle

Returns:

- [NVML_SUCCESS](#) if *device* has been set
- [NVML_ERROR_UNINITIALIZED](#) if the library has not been successfully initialized

- [NVML_ERROR_NOT_FOUND](#) if *pciBusId* does not match a valid device on the system
- [NVML_ERROR_INSUFFICIENT_POWER](#) if the attached device has improperly attached external power cables

- [NVML_ERROR_NO_PERMISSION](#) if the user doesn't have permission to talk to this device

6.11.2.23 `nvmlReturn_t DECLDIR nvmlDeviceGetHandleBySerial (const char * serial, nvmlDevice_t * device)`

Acquire the handle for a particular device, based on its board serial number.

For all products.

This number corresponds to the value printed directly on the board, and to the value returned by [nvmlDeviceGetSerial\(\)](#).

Deprecated

Since more than one GPU can exist on a single board this function is deprecated in favor of [nvmlDeviceGetHandleByUUID](#). For dual GPU boards this function will return [NVML_ERROR_INVALID_ARGUMENT](#).

Starting from NVML 5, this API causes NVML to initialize the target GPU NVML may initialize additional GPUs as it searches for the target GPU

Parameters:

Current S-Class products don't provide unique LEDs for each unit. As such, both front and back LEDs will be toggled in unison regardless of which unit is specified with this command.

See [nvmlLedColor_t](#) for available colors.

Parameters:

- unit* The identifier of the target unit
- color* The target LED color

Returns:

- [NVML_SUCCESS](#) if the LED color has been set
- [NVML_ERROR_UNINITIALIZED](#) if the library has not been successfully initialized
- [NVML_ERROR_INVALID_ARGUMENT](#) if *unit* or *color* is invalid
- [NVML_ERROR_NOT_SUPPORTED](#) if this is not an S-class product
- [NVML_ERROR_NO_PERMISSION](#) if the user doesn't have permission to perform this operation

6.13.1 Detailed Description

This chapter describes NVML operations that change the state of the device. Each of these requires root/admin access. Non-admin users will see an NVML_ERROR_NO_PERMISSION error code when invoking any of these methods.

6.13.2 Function Documentation

Changes the root/admin restrictions on certain APIs. See `nvmlRestrictedAPI_t` for the list of supported APIs. This method can be used by a root/admin user to give non-root/admin access to certain otherwise-restricted APIs. The new setting lasts for the lifetime of the NVIDIA driver; it is not persistent. See `nvmlDeviceGetAPIRestriction` to query the current restriction settings.

For Tesla and Quadro &tm products from the Kepler+ family. Requires root/admin permissions.

Parameters:

- [NVML_ERROR_INVALID_ARGUMENT](#) if *device* is invalid or *apiType* incorrect
- [NVML_ERROR_NOT_SUPPORTED](#) if the device does not support changing API restrictions
- [NVML_ERROR_NO_PERMISSION](#) if the user doesn't have permission to perform this operation

6.13.2.3 `nvmlReturn_t DECLDIR nvmlDeviceSetApplicationsClocks (nvmlDevice_t device, unsigned int memClockMHz, unsigned int graphicsClockMHz)`

Set clocks that applications will lock to.

Sets the clocks that compute and graphics applications will be running at. e.g. CUDA driver requests these clocks during context creation which means this property defines clocks at which CUDA applications will be running unless some overspec event occurs (e.g. over power, over thermal or external HW brake).

Can be used as a setting to request constant performance.

For Tesla TMproducts from the Kepler family. Requires root/admin permissions.

See [nvmlDeviceGetSupportedMemoryClocks](#) and [nvmlDeviceGetSupportedGraphicsClocks](#) for details on how to list available clocks combinations.

After system reboot or driver reload applications clocks go back to their default value. See [nvmlDeviceResetApplicationsClocks](#).

Parameters:

device The identifier of the target device
memClockMHz Requested memory clock in MHz
graphicsClockMHz Requested graphics clock in MHz

Returns:

- [NVML_SUCCESS](#) if new settings were successfully set
- [NVML_ERROR_UNINITIALIZED](#) if the library has not been successfully initialized
- [NVML_ERROR_INVALID_ARGUMENT](#) if *device* is invalid or *memClockMHz* and *graphicsClockMHz* is not a valid clock combination
- [NVML_ERROR_NO_PERMISSION](#) if the user doesn't have permission to perform this operation
- [NVML_ERROR_NOT_SUPPORTED](#) if the device doesn't support this feature
- [NVML_ERROR_GPU_IS_LOST](#) if the target GPU has fallen off the bus or is otherwise inaccessible

6.13.2.4 `nvmlReturn_t DECLDIR nvmlDeviceSetComputeMode (nvmlDevice_t device, nvmlComputeMode_t mode)`

Set the compute mode for the device.

For all CUDA-capable products. Requires root/admin permissions.

The compute mode determines whether a GPU can be used for compute operations and whether it can be shared across contexts.

This operation takes effect immediately. Under Linux it is not persistent across reboots and always resets to "Default". Under windows it is persistent.

Under windows compute mode may only be set to DEFAULT when running in WDDM

See [nvmlComputeMode_t](#) for details on available compute modes.

Parameters:

device The identifier of the target device
mode The target compute mode

Returns:

- [NVML_SUCCESS](#) if the compute mode was set
- [NVML_ERROR_UNINITIALIZED](#) if the library has not been successfully initialized
- [NVML_ERROR_INVALID_ARGUMENT](#) if *device* is invalid or *mode* is invalid
- [NVML_ERROR_NOT_SUPPORTED](#) if the device does not support this feature
- [NVML_ERROR_NO_PERMISSION](#) if the user doesn't have permission to perform this operation
- [NVML_ERROR_GPU_IS_LOST](#) if the target GPU has fallen off the bus or is otherwise inaccessible

[nvmlDeviceGetComputeMode\(\)](#)

6.13.2.5 `nvmlReturn_t DECLDIR nvmlDeviceSetDriverModel (nvmlDevice_t device, nvmlDriverModel_t driverModel, unsigned int flags)`

Set the driver model for the device.

For Tesla TMand Quadro [®]products from the Fermi and Kepler families. For windows only. Requires root/admin permissions.

On Windows platforms the device driver can run in either WDDM or WDM (TCC) mode. If a display is attached to the device it must run in WDDM mode.

It is possible to force the change to WDM (TCC) while the display is still attached with a force flag (`nvmlFlagForce`). This should only be done if the host is subsequently powered down and the display is detached from the device before the next reboot.

This operation takes effect after the next reboot.

Windows driver model may only be set to WDDM when running in DEFAULT compute mode.

Change driver model to WDDM is not supported when GPU doesn't support graphics acceleration or will not support it after reboot. See [nvmlDeviceSetGpuOperationMode](#).

See [nvmlDriverModel_t](#) for details on available driver models. See [nvmlFlagDefault](#) and [nvmlFlagForce](#)

Parameters:

- device* The identifier of the target device
- driverModel* The target driver model
- flags* Flags that change the default behavior

Returns:

- [NVML_SUCCESS](#) if the driver model has been set
- [NVML_ERROR_UNINITIALIZED](#) if the library has not been successfully initialized
- [NVML_ERROR_INVALID_ARGUMENT](#) if *device* is invalid or *driverModel* is invalid
- [NVML_ERROR_NOT_SUPPORTED](#) if the platform is not windows or the device does not support this feature
- [NVML_ERROR_NO_PERMISSION](#) if the user doesn't have permission to perform this operation
- [NVML_ERROR_GPU_IS_LOST](#) if the target GPU has fallen off the bus or is otherwise inaccessible
- [NVML_ERROR_UNKNOWN](#) on any unexpected error

Set the ECC mode for the device.

For Tesla TMand Quadro [®]products from the Fermi and Kepler families. Requires `NVML_INFOROM_ECC` version 1.0 or higher. Requires root/admin permissions.

The ECC mode determines whether the GPU enables its ECC support.

This operation takes effect after the next reboot.

See [nvmlEnableState_t](#) for details on available modes.

Parameters:

device The identifier of the target device

ecc The target ECC mode

Returns:

- [NVML_SUCCESS](#) if the ECC mode was set
- [NVML_ERROR_UNINITIALIZED](#) if the library has not been successfully initialized

- [NVML_ERROR_NO_PERMISSION](#) if the user doesn't have permission to perform this operation
- [NVML_ERROR_GPU_IS_LOST](#) if the target GPU has fallen off the bus or is otherwise inaccessible

For GK110 M-class and X-class Tesla™ products from the Kepler family. Not supported on Quadro® and Tesla™ C-class products. Requires root/admin permissions.

Changing GOMs requires a reboot. The reboot requirement might be removed in the future.

Compute only GOMs don't support graphics acceleration. Under windows switching to these GOMs when pending driver model is WDDM is not supported. See [nvmlDeviceSetDriverModel](#).

Parameters:

device The identifier of the target device

mode Target GOM

Returns:

- [NVML_SUCCESS](#) if *mode* has been set
- [NVML_ERROR_UNINITIALIZED](#) if the library has not been successfully initialized

- [NVML_ERROR_NOT_SUPPORTED](#) if the device does not support GOM or specific mode
- [NVML_ERROR_NO_PERMISSION](#) if the user doesn't have permission to perform this operation
- [NVML_ERROR_GPU_IS_LOST](#) if the target GPU has fallen off the bus or is otherwise inaccessible

Set the persistence mode for the device.

For all CUDA-capable products. For Linux only. Requires root/admin permissions.

The persistence mode determines whether the GPU driver software is torn down after the last client exits.

This operation takes effect immediately. It is not persistent across reboots. After each reboot the persistence mode is reset to "Disabled".

See [nvmlEnableState_t](#) for available modes.

Parameters:

Parameters:

device The identifier of the target device

eventTypes Reference in which to return bitmask of supported events

Returns:

- [NVML_SUCCESS](#) if the eventTypes has been set
- [NVML_ERROR_UNINITIALIZED](#) if the library has not been successfully initialized
- [NVML_ERROR_INVALID_ARGUMENT](#) if *eventType* is NULL

[Event Types](#)
[nvmlDeviceRegisterEvents](#)

6.14.3.2 `nvmlReturn_t DECLDIR nvmlDeviceRegisterEvents (nvmlDevice_t device, unsigned long long eventTypes, nvmlEventSet_t set)`

Starts recording of events on a specified devices and add the events to specified [nvmlEventSet_t](#)

For Linux only.

IMPORTANT: Operations on *set* are not thread safe

This call starts recording of events on specific device. All events that occurred before this call are not recorded. Checking if some event occurred can be done with [nvmlEventSetWait](#)

If function reports NVML_ERROR_UNKNOWN, event set is in undefined state and should be freed. If function reports NVML_ERROR_NOT_SUPPORTED, event set can still be used. None of the requested eventTypes are registered in that case.

Parameters:

device The identifier of the target device
eventTypes Bitmask of [Event Types](#) to record
set Set to which add new event types

Returns:

- [NVML_SUCCESS](#) if the event has been set
- [NVML_ERROR_UNINITIALIZED](#) if the library has not been successfully initialized

See also:

[nvmlDeviceRegisterEvents](#)

Returns:

- [NVML_SUCCESS](#) if the data has been set
- [NVML_ERROR_UNINITIALIZED](#) if the library has not been successfully initialized
- [NVML_ERROR_INVALID_ARGUMENT](#) if *data* is NULL
- [NVML_ERROR_TIMEOUT](#) if no event arrived in specified timeout or interrupt arrived
